

Introductory Statistics and Random Phenomena: Uncertainty, Complexity and Chaotic Behavior in Engineering and Science (Statistics for Industry and Technology)

The present book is based on a course developed as part of the large NSF-funded Gateway Coalition Initiative in Engineering Education which included Case Western Reserve University, Columbia University, Cooper Union, Drexel University, Florida International University, New Jersey Institute of Technology, Ohio State University, University of Pennsylvania, Polytechnic University, and University of South Carolina. The Coalition aimed to restructure the engineering curriculum by incorporating the latest technological innovations and tried to attract more and better students to engineering and science. Drafts of this textbook have been used since 1992 in statistics courses taught at CWRU, Indiana University, Bloomington, and at the universities in Göttingen, Germany, and Grenoble, France. Another purpose of this project was to develop a courseware that would take advantage of the Electronic Learning Environment created by CWRU net—the all fiber-optic Case Western Reserve University computer network, and its ability to let students run Mathematica experiments and projects in their dormitory rooms, and interact paperlessly with the instructor. Theoretically, one could try to go through this book without doing Mathematica experiments on the computer, but it would be like playing Chopin's Piano Concerto in E-minor, or Pink Floyd's The Wall, on an accordion. One would get an idea of what the tune was without ever experiencing the full richness and power of the entire composition, and the whole ambience would be missed.
