

Solution Of The K(Gv) Problem, The

The $k(Gv)$ conjecture claims that the number of conjugacy classes (irreducible characters) of the semidirect product Gv is bounded above by the order of V . Here V is a finite vector space and G a subgroup of $GL(V)$ of order prime to that of V . It may be regarded as the special case of Brauers celebrated $k(B)$ problem dealing with p -blocks B of p -solvable groups (p a prime). Whereas Brauers problem is still open in its generality, the $k(Gv)$ problem has recently been solved, completing the work of a series of authors over a period of more than forty years. In this book the developments, ideas and methods, leading to this remarkable result, are described in detail.
